DEPLOYMENT OF THE APPLICATION FOR ACCOUNTING OF CLEANING SERVICES

The general deployment process consists of several interrelated activities with possible transitions between them. Heroku cloud platform was used for this process implementation.

In order to start using Heroku a pipeline with front – end and back – end sides of the application were created. Next stage is to configure variables and to connect to the github master branch. As there is the connection with the master branch of github, when any changes push to the master branch after all work flow of CodeShip Continuous Integration, the new changes are automatically deployed on Heroku.

The deployment configuration on CodeShip is shown in figure 1. The front – end and back – end sides views on Heroku are shown in figure 2.
